INTERNATIONAL PATENT CLASS: G06F-017/60;

ABSTRACT EP 917077 A2
    The present invention utilizes wireless communication paths between a
  PC (600) and a Personal Digital Assistant (PDA) (602) to synchronize data
  files between the PC and the PDA. Example wireless communication paths
  include a one; way paging network, a two-way paging network (152), a
  Cellular Digital Packet Data (CDPD) network, and a cordless telephone
  network. Automated updating of remote files is accomplished by invisibly
  updating using a paging or CDPD network, e.g., either after each change
  to the data file, after a series of changes to the data file, after
  exiting the scheduling application program, at predetermined intervals
  and/or even on-demand. The invention provides a simple and efficient
  wireless way to synchronize data files on separate computers which do not
  require a fixed, direct connection to each other, such as a direct
  connection through the PSTN, infrared link, or wired or wireless LAN type
  connection. The synchronization of data files can be updated on a
  frequent, inconspicuous and convenient basis.

ABSTRACT EP 898406 A2

  A telephone call handling device includes an incoming call select unit
  (111), a calling unit (113), and a recording unit (115). The incoming
  call select unit (111) provides a prompt to an incoming caller and
  responds to a selection made by the incoming caller. The calling unit
  (113) selectively calls a forwarding number in response to the selection
  made by the incoming caller. The recording unit (115) selectively records
  a message in response to the selection made by the incoming caller. In an
  alternative embodiment, a method of handling an incoming call includes
  the steps of providing a prompt to an incoming caller, receiving a
  response from the incoming caller, and selectively calling a forwarding
  number based on the received response.

ABSTRACT EP 898407 A2

According to the invention, a telephone call handling device includes a decoder (111) adapted to decode call related information received with an incoming call, and a calling unit (113) adapted to call a paging number with a message based on the call related information. In an alternative embodiment, a method of handling an incoming call includes counting the number of ring signals in the incoming call in a ring detector (115), decoding call related information from the incoming call, and selectively calling a paging number with a message based on the call related information if the number of rings counted in the counting step exceeds a predetermined threshold.

INTERNATIONAL PATENT CLASS: H05B-006/80

ABSTRACT EP 1085785 A2
   The present invention provides an adaptive microwave oven capable of
entering an operation mode which avoids interference with a communication
device either upon detection of a communication from a communication
device (e.g., a cordless telephone) operating in a microwave frequency
range, or upon receipt of a command indicating the operation of a
microwave device such as a cordless telephone through a suitable network
(e.g., a piconet using Bluetooth Technology). In one embodiment, a
cooking mode of a microwave oven is paused (or significantly reduced) to
best avoid interference with microwave signals between a remote handset
and a matching base unit of a cordless telephone. The activity of
microwave communications within the vicinity of the adaptive microwave
oven can be determined, e.g., using a passive cordless telephone receiver
which detects communication activity in the microwave range, or using
direct communications from the cordless telephone using a suitable
wireless network, e.g., a piconet using Bluetooth technology. In another
embodiment, the frequency of an adaptive microwave oven capable of
generating microwave energy at any of a plurality of microwave frequency
ranges is controlled in accordance with the microwave frequency used by
an electronic device (e.g., a cordless telephone) in the vicinity of the
adaptive microwave oven. In this embodiment, a cordless telephone
receiver can provide a controller for the adaptive microwave oven with
passively detected information regarding the frequency of communication
traffic in the vicinity of the microwave oven, or a wireless network can
be used to provide frequency information directly between the relevant
electronic device (e.g., cordless telephone) and the adaptive microwave
oven.

INTERNATIONAL PATENT CLASS: H04M-001/725
ABSTRACT EP 1051015 A2
    A wireless telephone dictation device includes a dictation mode in
  addition to an otherwise conventional wireless telephone mode. The
  dictation functionality of the wireless telephone dictation device is
  inconspicuous to those around the user of the device, and appears as if
  the device is a conventional wireless telephone. In a dictation mode, the
  wireless telephone dictation device records verbal passages from a user
  into an appropriate digital memory (or onto an analog cassette tape),
  under the control of buttons resembling those of a conventional wireless
  telephone (e.g., using various number keys of a twelve (12) digit
  alphanumeric keypad). The wireless telephone dictation device operates in
  an otherwise conventional fashion in a wireless telephone mode, allowing
  conventional wireless telephone (e.g., cellular telephone) functionality.
  A speech-to-text converter can be included to convert recorded verbal
  passages into text for display on an appropriate display. Preferably, the
  text display resembles that of a conventional wireless telephone. The
  wireless capability of the wireless telephone dictation device may be
  utilized to allow transfer of recorded dictation between wireless
  telephone dictation devices, or between a wireless telephone dictation
  device and a land-based dictation database.
